

Quick-Start Guide — 5 Minutes to Your First Rendering

1. Five-Minute Setup

```
cd /home/ubuntu/scripts
bash setup.sh
python3 signage_cli.py --help    # should print the command list
```

That's it. The folder structure, logos, and tracker are already built — open `/home/ubuntu/ON_THE_BOULEVARD/` and look around.

2. Your First Rendering (worked example: Lola Pink)

```
cd /home/ubuntu/scripts

# Step 1 – build the four scene prompts for this tenant
python3 signage_cli.py prompts --tenant "Lola Pink"

# Step 2 – render the hero storefront (daytime)
python3 signage_cli.py render --tenant "Lola Pink" --scene hero_storefront

# Step 3 – QC the result
python3 signage_cli.py qc --tenant "Lola Pink"

# Step 4 – if approved, move it to finals/
mv /home/ubuntu/ON_THE_BOULEVARD/TENANTS/111_Lola_Pink/renders/*hero*.png \
  /home/ubuntu/ON_THE_BOULEVARD/TENANTS/111_Lola_Pink/finals/
```

Open `PRODUCTION_TRACKER.xlsx` → `Rendering Status`, find the Lola Pink row, set **Hero Storefront Status = Approved**, fill in the date.

3. Common Workflows

Single tenant, all four scenes

```
for s in hero_storefront dusk_variant close_up streetscape; do
  python3 signage_cli.py render --tenant "Lola Pink" --scene $s
done
```

Batch every tenant, hero only

```
python3 signage_cli.py render --all --scene hero_storefront
```

Export an investor package

```
python3 signage_cli.py export --all --target investor
# → /home/ubuntu/ON_THE_BOULEVARD/PORTFOLIO_EXPORTS/investor_package_*.zip
```

Add a brand-new tenant

1. Append the tenant to `/home/ubuntu/tenant_database.json`.
2. Run `python3 /home/ubuntu/build_otb.py`.
3. Add a row in the tracker.
4. Generate prompts → render → QC.

4. Where to Find Help

Need	Open
Full workflow & CLI reference	<code>OPERATOR_GUIDE.md</code>
Architecture & data flow	<code>SYSTEM_ARCHITECTURE.md</code>
What's already built	<code>PROJECT_SUMMARY.md</code>
Folder map	<code>DIRECTORY_TREE.txt</code>
Prompt layer cheat sheet	<code>MASTER_PROMPTS/INDEX.md</code>
Run logs	<code>/home/ubuntu/scripts/logs/</code>
